## II. CLAIM AMENDMENTS

1. (Original) A method of allocating data transmission resources in a packet-switched telecommunications system including a terminal and a fixed network to which an operational entity is defined for defining resources for a radio bearer, the method comprising steps of

defining a compression method of header fields in data packets used on the radio bearer, and

defining the radio bearer resources for the terminal on the basis of an application used by the terminal on said radio bearer in such a manner that said resources also comprise the capacity required by the selected compression method of header fields in data packets.

2. (Original) A method as claimed in claim 1, further comprising a step of

transmitting the compression methods of header fields in data packets, which are supported by the terminal, to the operational entity in the fixed network for defining the compression method to be used.

3. (Original) A method as claimed in claim 1, further comprising a step of

defining capacity in two directions for said radio bearer in response to the selected compression method of header fields in data packets requiring a bi-directional connection.

4. (Original) A method as claimed in claim 1, wherein

the packet-switched telecommunications system is a UMTS system and the operational entity for defining resources for the radio bearer comprises a radio resource control protocol and a radio resource management system.

5. (Original) A method as claimed in claim 4, wherein

the resources of said radio bearer are defined in the radio resource management system.

6. (Original) A method as claimed in claim 5, wherein

the defined radio bearer resources are transmitted to the radio resource control protocol which allocates the radio resources of the radio bearer.

7. (Previously Presented) A method as claimed in claim 4, wherein

the compression methods of header fields in data packets, which are supported by a convergence protocol of the terminal, are transmitted to a radio network controller for defining the compression method to be used.

- 8. (Original) A packet-switched telecommunications system including a terminal and a fixed network which comprises an operational entity for defining resources for a radio bearer, in which system
  - the compression method of header fields in data packets used on the radio bearer is configured to be defined, and
  - the resources of the radio bearer are configured to be defined on the basis of an application used by the terminal on said radio bearer in such a manner that said resources also comprise the capacity required by the selected compression method of header fields in data packets.
- 9. (Original) A telecommunications system as claimed in claim 8, wherein
  - the compression methods of header fields in data packets, which are supported by the terminal, are configured to be transmitted to the operational entity in the fixed network for defining the compression method to be used.
- 10. (Previously Presented) A telecommunications method as claimed in claim 8, wherein
  - the packet-switched telecommunications system is a UMTS system and the operational entity for defining resources for the radio bearer comprises a radio resource control protocol and a radio resource management system.

- 11. (New) A network element for a packet-switched telecommunications system, which network element comprises an operational entity for defining resources for a radio bearer, the network element being arranged to:
  - define a compression method of header fields in data packets used on the radio bearer;
  - define resources of the radio bearer on a basis of an application used by a terminal on the radio bearer; and
  - control a definition of the radio bearer resources in accordance with a capacity required by the defined compression method of header fields in data packets.
- 12. (New) A network element as claimed in claim 11, wherein the network element is further arranged to:
  - define capacity in two directions for the radio bearer in response to the defined compression method of header fields in data packets requiring a bi-directional connection.
- 13. (New) A network element as claimed in claim 11, wherein the network element comprises a radio resource control protocol and a radio resource management system as the operational entity for defining resources for the radio bearer.

14. (New) A network element as claimed in claim 13, wherein

the radio resource management system is arranged to define the resources of the radio bearer.

- 15. (New) A network element as claimed in claim 14, wherein the radio resource management system is arranged to transmit the defined radio bearer resources to the radio resource control protocol, which allocates the radio resources of the radio bearer.
- 16. (New) A terminal for a packet-switched telecommunications system, which terminal comprises at least one application capable of requesting radio bearer resources from a network of the packet-switched telecommunications system, the terminal being arranged to:
  - transmit information on compression methods of header fields in data packets supported by the terminal to the network; and
  - execute data transmission of the at least one application in accordance with a configuration of radio bearer resources defined by the network, wherein a definition of the radio bearer resources is controlled in accordance with a capacity required by a selected header compression method.
